Description

changeCovMtx2Rho

Change covariance matrix to Rho matrix.

Usage

changeCovMtx2Rho(CovMtx, alpha, theta, betaVec, PD = FALSE)

changeCovMtx2Rho

chf_NTS 3

chf_NTS

chf_NTS

Description

chf_NTS calculates Ch.F of the NTS distribution with parameters $(\alpha, \theta, \beta, \gamma, \mu)$. If a time parameter value is given, it calculates Ch.F of the NTS profess $\phi(u) = E[\exp(iu(X(t+s)-X(s)))] = \exp(t\log(E[\exp(iuX(1))]))$, where X is the NTS process generated by the NTS distribution with parameters $(\alpha, \theta, \beta, \gamma, \mu)$.

Usage

```
chf_NTS(u, param)
```

Arguments

ntsparam

u An array of u

A vector of the NTS parameters $(\alpha, \theta, \beta, \gamma, \mu)$. For NTS process case it is a

vector of parameters $(\alpha, \theta, \beta, \gamma, \mu, t)$.

Value

Characteristic function of the NTS distribution

```
library("temStaR")
alpha <- 1.2
theta <- 1
beta <- -0.2
gamma <- 0.3
mu <- 0.1
ntsparam <- c(alpha, theta, beta, gamma, mu)</pre>
u \leftarrow seq(from = -2*pi, to = 2*pi, length.out = 101)
phi <- chf_NTS(u, ntsparam)</pre>
#Annual based parameters
alpha <- 1.2
theta <- 1
beta <- -0.2
gamma <- 0.3
mu <- 0.1
#scaling annual parameters to one day
dt <- 1/250 #one day
ntsparam <- c(alpha, theta, beta, gamma, mu, dt)</pre>
u \leftarrow seq(from = -2*pi, to = 2*pi, length.out = 101)
phi <- chf_NTS(u, ntsparam)</pre>
```

4 chf_stdNTS

chf_stdNTS

chf_stdNTS

Description

chf_stdNTS calculates Ch.F of the standard NTS distribution with parameters (α, θ, β) . If a time parameter value is given, it calculates Ch.F of the standard NTS profess $\phi(u) = E[\exp(iu(X(t+s)-X(s)))] = \exp(t\log(E[\exp(iuX(1))]))$, where X is the standard NTS process generated by the standard NTS distribution with parameters (α, θ, β) .

Usage

```
chf_stdNTS(u, param)
```

Arguments

An array of u

ntsparam

A vector of the standard NTS parameters (α, θ, β) . For the standard NTS process case it is a vector of parameters $(\alpha, \theta, \beta, t)$.

Value

Characteristic function of the standard NTS distribution

```
library("temStaR")
alpha <- 1.2
theta <- 1
beta <- -0.2
ntsparam <- c(alpha, theta, beta)</pre>
u \leftarrow seq(from = -2*pi, to = 2*pi, length.out = 101)
phi <- chf_stdNTS(u, ntsparam)</pre>
#Annual based parameters
alpha <- 1.2
theta <- 1
beta <- -0.2
#scaling annual parameters to one day
dt <- 1/250 #one day
ntsparam <- c(alpha, theta, beta, gamma, mu, dt)</pre>
u \leftarrow seq(from = -2*pi, to = 2*pi, length.out = 101)
phi <- chf_stdNTS(u, ntsparam)</pre>
```

copulaStdNTS 5

copulaStdNTS	copulaStdNTS
--------------	--------------

Description

copulaStdNTS calculates the stdNTS copula values

Usage

```
copulaStdNTS(u, st, subTS = NULL)
```

References

Y. S. Kim, D. Volkmann (2013), Normal Tempered Stable Copula, Applied Mathematics Letters, 26(7), 676-680 https://www.sciencedirect.com/science/article/pii/S0893965913000384

cvarGauss cvarGauss

Description

Calculate the CVaR for the normal distributed market model. Developer's version.

Usage

```
cvarGauss(eta, mu = 0, sigma = 1)
```

cvarmarginalmnts cvarmarginalmnts

Description

cvarmarginalmnts calculates the CVaR of the n-th element of the multivariate NTS distributed random variable.

Usage

```
cvarmarginalmnts(eta, n, st)
```

Arguments

eta the significant level for CVaR. Real value between 0 and 1.

n the n-th element to be calculated.

st Structure of parameters for the n-dimensional NTS distribution.

6 cvarnts

cvarnts

cvarnts

Description

cvarnts calculates Conditional Value at Risk (CVaR, or expected shortfall ES) of the NTS market model with parameters $(\alpha, \theta, \beta, \gamma, \mu)$. If only three parameters are given, it calculates CVaR of the standard NTS distribution with parameter (α, θ, β)

Usage

```
cvarnts(eps, ntsparam)
```

Arguments

eps the significant level for CVaR. Real value between 0 and 1.

ntsparam A vector of the NTS parameters $(\alpha, \theta, \beta, \gamma, \mu)$. A vector of the standard NTS

parameters (α, θ, β) .

Value

CVaR of the NTS distribution.

```

dBeta 7

```
beta <- -0.2 gamma <- 0.3 mu <- 0.1 #scaling annual parameters to one day dt <- 1/250 #one day ntsparam <- c(alpha, theta, beta, gamma, mu, dt) u <- c(0.01, 0.05) q <- cvarnts(u, ntsparam)
```

dBeta

dBeta

Description

The first derivative of the beta. Developer's version.

Usage

```
dBeta(n, w, betaArray, covMtx)
```

dcopulaStdNTS

dcopulaStdNTS

Description

dcopulaStdNTS calculates density of the stdNTS copula.

Usage

```
dcopulaStdNTS(u, st, subTS = NULL)
```

References

Y. S. Kim, D. Volkmann (2013), Normal Tempered Stable Copula, Applied Mathematics Letters, 26(7), 676-680 https://www.sciencedirect.com/science/article/pii/S0893965913000384

dCVaR_numint

 $dCVaR_numint$

Description

The first derivative of CVaR for the beta parameter of the stdNTS. Developer's version.

Usage

```
dCVaR_numint(eta, alpha, theta, beta, N = 200, rho = 0.1)
```

8 dmnts

dinvCdf_stdNTS

 $dinvCdf_stdNTS$

Description

The first derivative of inverse CDF for the beta parameter of the stdNTS. Developer's version.

Usage

```
dinvCdf_stdNTS(eta, alpha, theta, beta)
```

dmarginalmnts

dmarginalmnts

Description

dmarginalmnts calculates the marginal density of the n-th element of the multivariate NTS distributed random variable.

Usage

```
dmarginalmnts(x, n, st)
```

Arguments

the x such that $f(x) = \frac{d}{dx} P(X_n < x)$

n the n-th element to be calculated.

st Structure of parameters for the n-dimensional NTS distribution.

dmnts dmnts

Description

dmnts calculates the density of the multivariate NTS distribution: $f(x_1, \cdots, x_n) = \frac{d^n}{dx_1 \cdots dx_n} P(x_n < R_1, \cdots, x_n < R_n)$. The multivariate NTS random vector $R = (R_1, \cdots, R_n)$ is defined

$$R = \mu + diag(\sigma)X,$$

where

X follows $stdNTS_n(\alpha, \theta, \beta, \Sigma)$

Usage

```
dmnts(x, st, subTS = NULL)
```

dmnts 9

Arguments

```
x array of the (x_1,\cdots,x_n) st Structure of parameters for the n-dimensional NTS distribution. st$ndim: dimension st$mu: \mu mean vector (column vector) of the input data. st$sigma: \sigma standard deviation vector (column vector) of the input data. st$alpha: \alpha of the std NTS distribution (X). st$theta: \theta of the std NTS distribution (X). st$beta: \beta vector (column vector) of the std NTS distribution (X). st$Rho: \rho matrix of the std NTS distribution (X). numofsample number of samples.
```

Value

Simulated NTS random vectors

```

10 dnts

dnts dnts

Description

dnts calculates pdf of the NTS distribution with parameters $(\alpha, \theta, \beta, \gamma, \mu)$. If only three parameters are given, it calculates pdf of the standard NTS distribution with parameter (α, θ, β) If a time parameter value is given, it calculates pdf of the NTS profess f(x)dx = d(P((X(t+s) - X(s)) < x)), where X is the NTS process generated by the NTS distribution with parameters $(\alpha, \theta, \beta, \gamma, \mu)$.

Usage

```
dnts(xdata, ntsparam)
```

Arguments

xdata An array of x

ntsparam A vector of the NTS parameters $(\alpha, \theta, \beta, \gamma, \mu)$. For the NTS process case it is a

vector of parameters $(\alpha, \theta, \beta, \gamma, \mu, t)$. A vector of the standard NTS parameters

 (α, θ, β) .

Value

Density of NTS distribution

References

Kim, Y. S. (2020) Portfolio Optimization on the Dispersion Risk and the Asymmetric Tail Risk https://arxiv.org/pdf/2007.13972.pdf

```
library("temStaR")
alpha <- 1.2

plot(x,d,type = '1')</pre>
```

fitmnts

fitmnts

Description

```
fitmnts fit parameters of the n-dimensional NTS distribution.
```

```
r=\mu+diag(\sigma)X where X \mbox{ follows } stdNTS_n(\alpha,\theta,\beta,\Sigma)
```

Usage

```
\code{res <- fitmnts(returndata, n)}
\code{res <- fitmnts(returndata, n, alphaNtheta = c(alpha, theta))}
\code{res <- fitmnts(returndata, n, stdflag = TRUE ) }
\code{res <- fitmnts(returndata, n, alphaNtheta = c(alpha, theta), stdflag = TRUE)}</pre>
```

Arguments

Raw data to fit the parameters. The data must be given as a matrix form. Each

column of the matrix contains a sequence of asset returns. The number of row

of the matrix is the number of assets.

n Dimension of the data. That is the number of assets.

alphaNtheta If α and θ are given, then put those numbers in this parameter. The function fixes

those parameters and fits other remaining parameters. If you set alphaNtheta

= NULL, then the function fits all parameters including α and θ .

Value

Structure of parameters for the n-dimensional NTS distribution.

res\$mu : μ mean vector of the input data.

res $sigma: \sigma$ standard deviation vector of the input data.

res\$alpha : α of the std NTS distribution (X). res\$theta : θ of the std NTS distribution (X).

res\$beta : β vector of the std NTS distribution (X).

res\$Rho: ρ matrix of the std NTS distribution (X), which is correlation matrix of epsilon.

res\$CovMtx: Covariance matrix of return data r.

```

fitnts

fitnts

Description

fitnts fit parameters $(\alpha, \theta, \beta, \gamma, \mu)$ of the NTS distribution. This function using the curvefit method between the empirical cdf and the NTS cdf.

Usage

```
\code{fitnts(rawdat)}
\code{fitnts(rawdat), ksdensityflag = 1}
\code{fitnts(rawdat, initialparam = c(alpha, theta, beta, gamma, mu))}
\code{fitnts(rawdat, initialparam = c(alpha, theta, beta, gamma, mu)), ksdensityflag = 1}
\code{fitnts(rawdat, initialparam = c(alpha, theta, beta, gamma, mu)), maxeval = 100, ksdensityflag
```

Arguments

rawdat

Raw data to fit the parameters.

14 fitstdnts

initialparam A vector of initial NTS parameters. This function uses the nloptr package. If

it has a good initial parameter then estimation performs better. If users do not know a good initial parameters, then just set it as initialparam=NaN, that is default. The function cffitnts() may be helpful to find the initial parameters.

maxeval Maximum evaluation number for nloptr. The iteration stops on this many func-

tion evaluations.

ksdensityflag
This function fit the parameters using the curvefit method between the empirical

cdf and the NTS cdf. If ksdensityflag = 1 (default), then the empirical cdf is calculated by the kernel density estimation. If ksdensityflag = 0, then the

empirical cdf is calculated by the empirical cdf.

Value

Estimated parameters

```

fitstdnts

fitstdnts

Description

fitstdnts fit parameters (α, θ, β) of the standard NTS distribution. This function using the curvefit method between the empirical cdf and the standard NTS cdf.

fitstdnts 15

Usage

```
\code{fitstdnts(rawdat)}
\code{fitstdnts(rawdat), ksdensityflag = 1}
\code{fitstdnts(rawdat, initialparam = c(alpha, theta, beta))}
\code{fitstdnts(rawdat, initialparam = c(alpha, theta, beta)), ksdensityflag = 1}
\code{fitstdnts(rawdat, initialparam = c(alpha, theta, beta)), maxeval = 100, ksdensityflag = 1}
```

Arguments

rawdat Raw data to fit the parameters.

initialparam A vector of initial standard NTS parameters. This function uses the nloptr

package. If it has a good initial parameter then estimation performs better. If users do not know a good initial parameters, then just set it as initialparam=NaN,

that is default.

maxeval Maximum evaluation number for nloptr. The iteration stops on this many func-

tion evaluations.

ksdensityflag This function fit the parameters using the curvefit method between the empirical

cdf and the standard NTS cdf. If ksdensityflag = 1 (default), then the empirical cdf is calculated by the kernel density estimation. If ksdensityflag = 0,

then the empirical cdf is calculated by the empirical cdf.

16 gensamplepathnts

```
fitstdntsFixAlphaThata
```

fitstdntsFixAlphaThata

Description

Fit beta of stdNTS distribution with fixed alpha and theta.

Usage

```
fitstdntsFixAlphaThata(
  rawdat,
  alpha,
  theta,
  initialparam = NaN,
  maxeval = 100,
  ksdensityflag = 1
)
```

gensamplepathnts

gensamplepathnts

Description

gensamplepathnts generate sample paths of the NTS process with parameters $(\alpha, \theta, \beta, \gamma, \mu)$. If only three parameters are given, it generate sample paths of the standard NTS process with parameters (α, θ, β) .

Usage

```
gensamplepathnts(npath, ntimestep, ntsparam, dt)
```

Arguments

npath	Number of sample paths
ntimestep	number of time step
ntsparam	A vector of the NTS parameters $(\alpha, \theta, \beta, \gamma, \mu)$. A vector of the standard NTS parameters (α, θ, β) .
dt	the time length of one time step by the year fraction. "dt=1" means 1-year.

Value

Structure of the sample path. Matrix of sample path. Column index is time.

getGammaVec 17

Examples

```
library("temStaR")
#standard NTS process sample path
alpha <- 1.2
theta <- 1
beta <- -0.2
ntsparam <- c(alpha, theta, beta)</pre>
npath <- 5
ntimestep <- 250
dt <- 1/250
simulation <- gensamplepathnts(npath, ntimestep, ntsparam, dt)</pre>
matplot(colnames(simulation), t(simulation), type = 'l')
#NTS process sample path
alpha <- 1.2
theta <- 1
beta <- -0.2
gamma <- 0.3
mu <- 0.1
ntsparam <- c(alpha, theta, beta, gamma, mu)</pre>
npath <- 5
ntimestep <- 250
dt <- 1/250

matplot(colnames(simulation), t(simulation), type = 'l')
```

getGammaVec

getGammaVec

Description

beta to gamma in StdNTS

Usage

```
getGammaVec(alpha, theta, betaVec)
```

getPortNTSParam

getPortNTSParam

Description

Portfolio return with capital allocation weight is $R_p = \langle w, r \rangle$, which is a weighted sum of of elements in the N-dimensional NTS random vector. R_p becomes an 1-dimensional NTS random variable. getPortNTSParam find the parameters of R_p .

Usage

```
\code{res <- setPortfolioParam(strPMNTS,w)}
\code{res <- setPortfolioParam(strPMNTS,w, FALSE)}</pre>
```

18 getPortNTSParam

Arguments

strPMNTS Structure of parameters for the n-dimensional NTS distribution.

strPMNTS\$ndim: dimension

 $strPMNTS$mu: \mu mean vector (column vector) of the input data.$

strPMNTSsigma : σ standard deviation vector (column vector) of the input

data.

strPMNTS\$alpha : α of the std NTS distribution (X). strPMNTS\$theta : θ of the std NTS distribution (X).

strPMNTS\$beta : β vector (column vector) of the std NTS distribution (X).

res\$Rho : ρ matrix (Correlation) of the std NTS distribution (X).

resSigma: Covariance Σ matrix of return data r.

w Capital allocation weight vector.

stdform If stdform is FALSE, then the return parameter has the following representation

 $R_p = \langle w, r \rangle = \mu + diag(\sigma)X,$

where

X follows $stdNTS_1(\alpha, \theta, \beta, 1)$.

If stdform is TRUE, then the return parameter has the following representation

 $R_p = \langle w, r \rangle$ follows $NTS_1(\alpha, \theta, \beta, \gamma, \mu, 1)$

Value

The weighted sum follows 1-dimensional NTS.

 $R_p = \langle w, r \rangle = \mu + diag(\sigma)X,$

where

X follows $stdNTS_1(\alpha, \theta, \beta, 1)$.

Hence we obtain

res\$mu : μ mean of R_p .

res $sigma: \sigma$ standard deviation of R_p .

 $\label{eq:alpha:alpha:alpha:alpha:alpha:alpha:alpha:alpha:baselength} \alpha \mbox{ of } X.$ $\mbox{res\$beta:} \beta \mbox{ of } X.$

importantSamplining 19

importantSamplining

importantSamplining

Description

importantSamplining do the important sampling for the TS Subordinator.

Usage

```
importantSamplining(alpha, theta)
```

ipnts

ipnts

Description

ipnts calculates inverse cdf of the NTS distribution with parameters $(\alpha, \theta, \beta, \gamma, \mu)$. If only three parameters are given, it calculates inverse cdf of the standard NTS distribution with parameter (α, θ, β)

Usage

```
ipnts(u, ntsparam, maxmin = c(-10, 10), du = 0.01)
```

Arguments

u Real value between 0 and 1

ntsparam A vector of the NTS parameters $(\alpha, \theta, \beta, \gamma, \mu)$. A vector of the standard NTS

parameters (α, θ, β) .

Value

Inverse cdf of the NTS distribution. It is the same as qnts function.

```

 ${\tt mctCVaRmnts}$

mctCVaRmnts

Description

Calculate the marginal contribution to CVaR for the multivariate NTS market model: the random vector r is

```
r=\mu+diag(\sigma)X where X \mbox{ follows } stdNTS_N(\alpha,\theta,\beta,\Sigma)
```

Usage

```
\code{mctCVaRmnts(eta, n, w, st)}
```

mctCVaRmnts 21

Arguments

eta	Significant level of CVaR.		
n	The targer stock to calculate the mctCVaR		
W	The capital allocation rate vector for the current portfolio		
st	Structure of parameters for the N-dimensional NTS distribution.		
st\$ndim: Dimension of the model. Here st\$ndim=N. st\$mu: μ mean vector (column vector) of the input data. st\$sigma: σ standard deviation vector (column vector) of the input data st\$alpha: α of the std NTS distribution (X). st\$theta: θ of the std NTS distribution (X).			
			st\$beta : β vector (column vector) of the std NTS distribution (X).
			st\$Rho : ρ matrix of the std NTS distribution (X), which is correlation matrix of epsilon.
			st $CovMtx$: Covariance matrix of return data r .

moments_NTS 25

moments_NTS

moments_NTS

Description

moments_NTS calculates mean, variance, skewness, and excess kurtosis of the NTS distribution with parameters $(\alpha, \theta, \beta, \gamma, \mu)$.

Usage

```
moments_NTS(param)
```

Arguments

param

A vector of the NTS parameters $(\alpha, \theta, \beta, \gamma, \mu)$.

Value

First 4 moments (Mean, Variance, Skewness, Excess Kurtosis) of NTS distribution. The mean is always the same as the parameter μ .

References

Kim, Y.S, K-H Roh, R. Douady (2020) Tempered Stable Processes with Time Varying Exponential Tails https://arxiv.org/pdf/2006.07669.pdf

Examples

```
library("temStaR")
alpha <- 1.2
theta <- 1
beta <- -0.2
gamma <- 0.3
mu <- 0.1
ntsparam <- c(alpha, theta, beta, gamma, mu)
moments_NTS(param = ntsparam)</pre>
```

moments_stdNTS

moments_stdNTS

Description

moments_stdNTS calculates mean, variance, skewness, and excess kurtosis of the standard NTS distribution with parameters (α, θ, β) .

Usage

```
moments_stdNTS(param)
```

Arguments

param

A vector of the standard NTS parameters (α, θ, β) .

26 pmnts

Value

First 4 moments (Mean, Variance, Skewness, Excess Kurtosis) of NTS distribution. Of course, the mean and variance are always 0 and 1, respectively.

pmarginalmnts

pmarginalmnts

Description

pmarginalmnts calculates the marginal cdf of the n-th element of the multivariate NTS distributed random variable.

Usage

```
pmarginalmnts(x, n, st)
```

Arguments

```
x the x such that F(x) = P(X_n < x) n the n-th element to be calculated. Structure of parameters for the n-dimensional NTS distribution.
```

pmnts pmnts

Description

```
pmnts calculates the cdf values of the multivariate NTS distribution: F(x_1,\cdots,x_n)=P(x_n< R_1,\cdots,x_n< R_n). The multivariate NTS random vector R=(R_1,\cdots,R_n) is defined R=\mu+diag(\sigma)X, where X follows stdNTS_n(\alpha,\theta,\beta,\Sigma)
```

pmnts 27

Usage

```
pmnts(x, st, subTS = NULL)
```

Arguments

```
x array of the (x_1,\cdots,x_n) st Structure of parameters for the n-dimensional NTS distribution. st$ndim: dimension st$mu: \mu mean vector (column vector) of the input data. st$sigma: \sigma standard deviation vector (column vector) of the input data. st$alpha: \alpha of the std NTS distribution (X). st$theta: \theta of the std NTS distribution (X). st$beta: \beta vector (column vector) of the std NTS distribution (X). st$Rho: \rho matrix of the std NTS distribution (X). number of samples.
```

Value

Simulated NTS random vectors

pnts

pnts

Description

pnts calculates cdf of the NTS distribution with parameters $(\alpha, \theta, \beta, \gamma, \mu)$. If only three parameters are given, it calculates cdf of the standard NTS distribution with parameter (α, θ, β) If a time parameter value is given, it calculates cdf of the profess F(x) = P((X(t+s) - X(s)) < x), where X is the NTS process generated by the NTS distribution with parameters $(\alpha, \theta, \beta, \gamma, \mu)$.

Usage

```
pnts(xdata, ntsparam, dz = 2^-8, m = 2^12)
```

Arguments

xdata

An array of x

ntsparam

A vector of the NTS parameters $(\alpha, \theta, \beta, \gamma, \mu)$. For the NTS process case it is a vector of parameters $(\alpha, \theta, \beta, \gamma, \mu, t)$. A vector of the standard NTS parameters (α, θ, β) .

Value

Cumulative probability of the NTS distribution

Usage

```
portfolioCVaRmnts(strPMNTS, w, eta)
```

Arguments

Value

portfolio value at risk on the NTS market model

30 qmarginalmnts

portfolioVaRmnts	portfolioVaRmnts
------------------	------------------

Description

Calculate portfolio value at risk on the NTS market model

Usage

```
portfolioVaRmnts(strPMNTS, w, eta)
```

Arguments

strPMNTS Structure of parameters for the n-dimensional NTS distribution.

strPMNTS\$ndim: dimension

 $trPMNTS\$: μ mean vector (column vector) of the input data.

strPMNTSsigma : σ standard deviation vector (column vector) of the input

data.

strPMNTS\$alpha : α of the std NTS distribution (X). strPMNTS\$theta : θ of the std NTS distribution (X).

strPMNTS\$beta : β vector (column vector) of the std NTS distribution (X).

 ${\tt res\$Rho}: \rho \ {\tt matrix} \ ({\tt Correlation}) \ {\tt of the std} \ {\tt NTS} \ {\tt distribution} \ ({\tt X}).$

 ${\tt res}$ Sigma : Covariance Σ matrix of return data r.

w Capital allocation weight vector.

eta significanlt level

Value

portfolio value at risk on the NTS market model

Description

qmarginalmnts calculates the quantile value of the n-th element of the multivariate NTS distributed random variable.

Usage

```
qmarginalmnts(u, n, st)
```

Arguments

u vector of probabilities.

n the n-th element to be calculated.

st Structure of parameters for the n-dimensional NTS distribution.

qnts 31

qnts qnts

Description

qnts calculates quantile of the NTS distribution with parameters $(\alpha, \theta, \beta, \gamma, \mu)$. If only three parameters are given, it calculates quantile of the standard NTS distribution with parameter (α, θ, β) If a time parameter value is given, it calculates quantile of NTS profess. That is it finds x such that u = P((X(t+s) - X(s)) < x), where X is the NTS process generated by the NTS distribution with parameters $(\alpha, \theta, \beta, \gamma, \mu)$.

Usage

```
qnts(u, ntsparam)
```

Arguments

u vector of probabilities.

ntsparam

A vector of the NTS parameters $(\alpha, \theta, \beta, \gamma, \mu)$. For the NTS process case it is a vector of parameters $(\alpha, \theta, \beta, \gamma, \mu, t)$. A vector of standard NTS parameters (α, θ, β) .

Value

The quantile function of the NTS distribution

```
library("temStaR")
alpha <- 1.2
theta <- 1
beta <- -0.2
ntsparam <- c(alpha, theta, beta)</pre>
u \leftarrow c(0.01, 0.05, 0.25, 0.5, 0.75, 0.95, 0.99)
q <- qnts(u, ntsparam)</pre>
alpha <- 1.2
theta <- 1
beta <- -0.2
gamma <- 0.3
ntsparam <- c(alpha, theta, beta, gamma, mu)</pre>
u \leftarrow c(0.01, 0.05, 0.25, 0.5, 0.75, 0.95, 0.99)
q <- qnts(u, ntsparam)</pre>
#Annual based parameters
alpha <- 1.2
theta <- 1
beta <- -0.2
gamma <- 0.3
mu <- 0.1
```

32 rmnts

```
#scaling annual parameters to one day dt <- 1/250 #one day ntsparam <- c(alpha, theta, beta, gamma, mu, dt) u <- c(0.01,0.05,0.25,0.5, 0.75, 0.95, 0.99) q <- qnts(u, ntsparam)
```

rmnts

rmnts

Description

rmnts generates random vector following the n dimensional NTS distribution using Cholesky decomposition.

```
r=\mu+diag(\sigma)X, where X \mbox{ follows } stdNTS_n(\alpha,\theta,\beta,\Sigma)
```

Usage

```
rmnts(strMnts, numofsample)
```

Arguments

numofsample number of samples.

strPMNTS Structure of parameters for the n-dimensional NTS distribution.

strPMNTS\$ndim: dimension

strPMNTS\$mu : μ mean vector (column vector) of the input data.

 ${\tt strPMNTS\$sigma}: \sigma \ {\tt standard} \ {\tt deviation} \ {\tt vector} \ ({\tt column} \ {\tt vector}) \ {\tt of} \ {\tt the} \ {\tt input}$

data.

strPMNTS\$alpha : α of the std NTS distribution (X). strPMNTS\$theta : θ of the std NTS distribution (X).

strPMNTS\$beta : β vector (column vector) of the std NTS distribution (X).

strPMNTS\$Rho : ρ matrix of the std NTS distribution (X).

Value

Simulated NTS random vectors

References

Kim, Y. S. (2020) Portfolio Optimization on the Dispersion Risk and the Asymmetric Tail Risk https://arxiv.org/pdf/2007.13972.pdf

rmnts_subord 33

Examples

rmnts_subord

rmnts_subord

Description

rmnts_subord generates random vector following the n dimensional NTS distribution using subordination.

```
r=\mu+diag(\sigma)X, where X \mbox{ follows } stdNTS_n(\alpha,\theta,\beta,\Sigma)
```

Usage

```
rmnts_subord(strPMNTS, numofsample, rW = NaN, rTau = NaN)
```

Arguments

Structure of parameters for the n-dimensional NTS distribution. $strPMNTS$ndim: dimension \\ strPMNTS$mu: μ mean vector (column vector) of the input data. \\ strPMNTS$sigma: σ standard deviation vector (column vector) of the input data.$

data. strPMNTS\$alpha: α of the std NTS distribution (X). strPMNTS\$theta: θ of the std NTS distribution (X).

strPMNTS\$beta : β vector (column vector) of the std NTS distribution (X). strPMNTS\$Rho : ρ matrix of the std NTS distribution (X).

numofsample number of samples.

Value

Simulated NTS random vectors

Kim, Y. S. (2020) Portfolio Optimization on the Dispersion Risk and the Asymmetric Tail Risk https://arxiv.org/pdf/2007.13972.pdf

34 rnts

Examples

rnts

rnts

Description

rnts generates random numbers following NTS distribution with parameters $(\alpha, \theta, \beta, \gamma, \mu)$. If only three parameters are given, it generates random numbers of standard NTS distribution with parameter (α, θ, β) If a time parameter value is given, it generates random numbers of increments of NTS profess for time interval t.

Usage

```
rnts(n, ntsparam)
```

Arguments

n number of random numbers to be generated.

ntsparam

A vector of NTS parameters $(\alpha, \theta, \beta, \gamma, \mu)$. For NTS process case it is a vector of parameters $(\alpha, \theta, \beta, \gamma, \mu, t)$. A vector of standard NTS parameters $(\alpha, \theta, \beta, \gamma, \mu, t)$.

Value

NTS random numbers

plot(r)
```

setPortfolioParam

setPortfolioParam

Description

 $Please \ use \ getPortNTSParam \ instead \ of \ setPortfolioParam.$

Portfolio return with capital allocation weight is $R_p = \langle w, r \rangle$, which is a weighted sum of of elements in the N-dimensional NTS random vector. R_p becomes an 1-dimensional NTS random variable. setPortfolioParam find the parameters of R_p .

Usage

```
\code{res <- setPortfolioParam(strPMNTS,w)}</pre>
```

Arguments

```
Structure of parameters for the n-dimensional NTS distribution.  \begin{split} & \mathsf{strPMNTS\$ndim}: \mathsf{dimension} \\ & \mathsf{strPMNTS\$mu}: \mu \; \mathsf{mean} \; \mathsf{vector} \; (\mathsf{column} \; \mathsf{vector}) \; \mathsf{of} \; \mathsf{the} \; \mathsf{input} \; \mathsf{data}. \\ & \mathsf{strPMNTS\$sigma}: \; \sigma \; \mathsf{standard} \; \mathsf{deviation} \; \mathsf{vector} \; (\mathsf{column} \; \mathsf{vector}) \; \mathsf{of} \; \mathsf{the} \; \mathsf{input} \; \mathsf{data}. \\ & \mathsf{strPMNTS\$alpha}: \; \alpha \; \mathsf{of} \; \mathsf{the} \; \mathsf{std} \; \mathsf{NTS} \; \mathsf{distribution} \; (X). \\ & \mathsf{strPMNTS\$theta}: \; \theta \; \mathsf{of} \; \mathsf{the} \; \mathsf{std} \; \mathsf{NTS} \; \mathsf{distribution} \; (X). \\ & \mathsf{strPMNTS\$beta}: \; \beta \; \mathsf{vector} \; (\mathsf{column} \; \mathsf{vector}) \; \mathsf{of} \; \mathsf{the} \; \mathsf{std} \; \mathsf{NTS} \; \mathsf{distribution} \; (X). \\ & \mathsf{strPMNTS\$Rho}: \; \Sigma \; \mathsf{matrix} \; \mathsf{of} \; \mathsf{the} \; \mathsf{std} \; \mathsf{NTS} \; \mathsf{distribution} \; (X). \\ & \mathsf{w} \; \qquad \mathsf{Capital} \; \mathsf{allocation} \; \mathsf{weight} \; \mathsf{vector}. \\ \end{split}
```

36 setPortfolioParam

Value

```
The weighted sum follows 1-dimensional NTS. R_p = < w, r > = \mu + diag(\sigma)X, where X \text{ follows } stdNTS_1(\alpha, \theta, \beta, 1). Hence we obtain \operatorname{res\$mu}: \mu \text{ mean of } R_p. \operatorname{res\$sigma}: \sigma \text{ standard deviation of } R_p. \operatorname{res\$alpha}: \alpha \text{ of } X. \operatorname{res\$theta}: \theta \text{ of } X. \operatorname{res\$beta}: \beta X.
```
